What is the Open Glider Network?

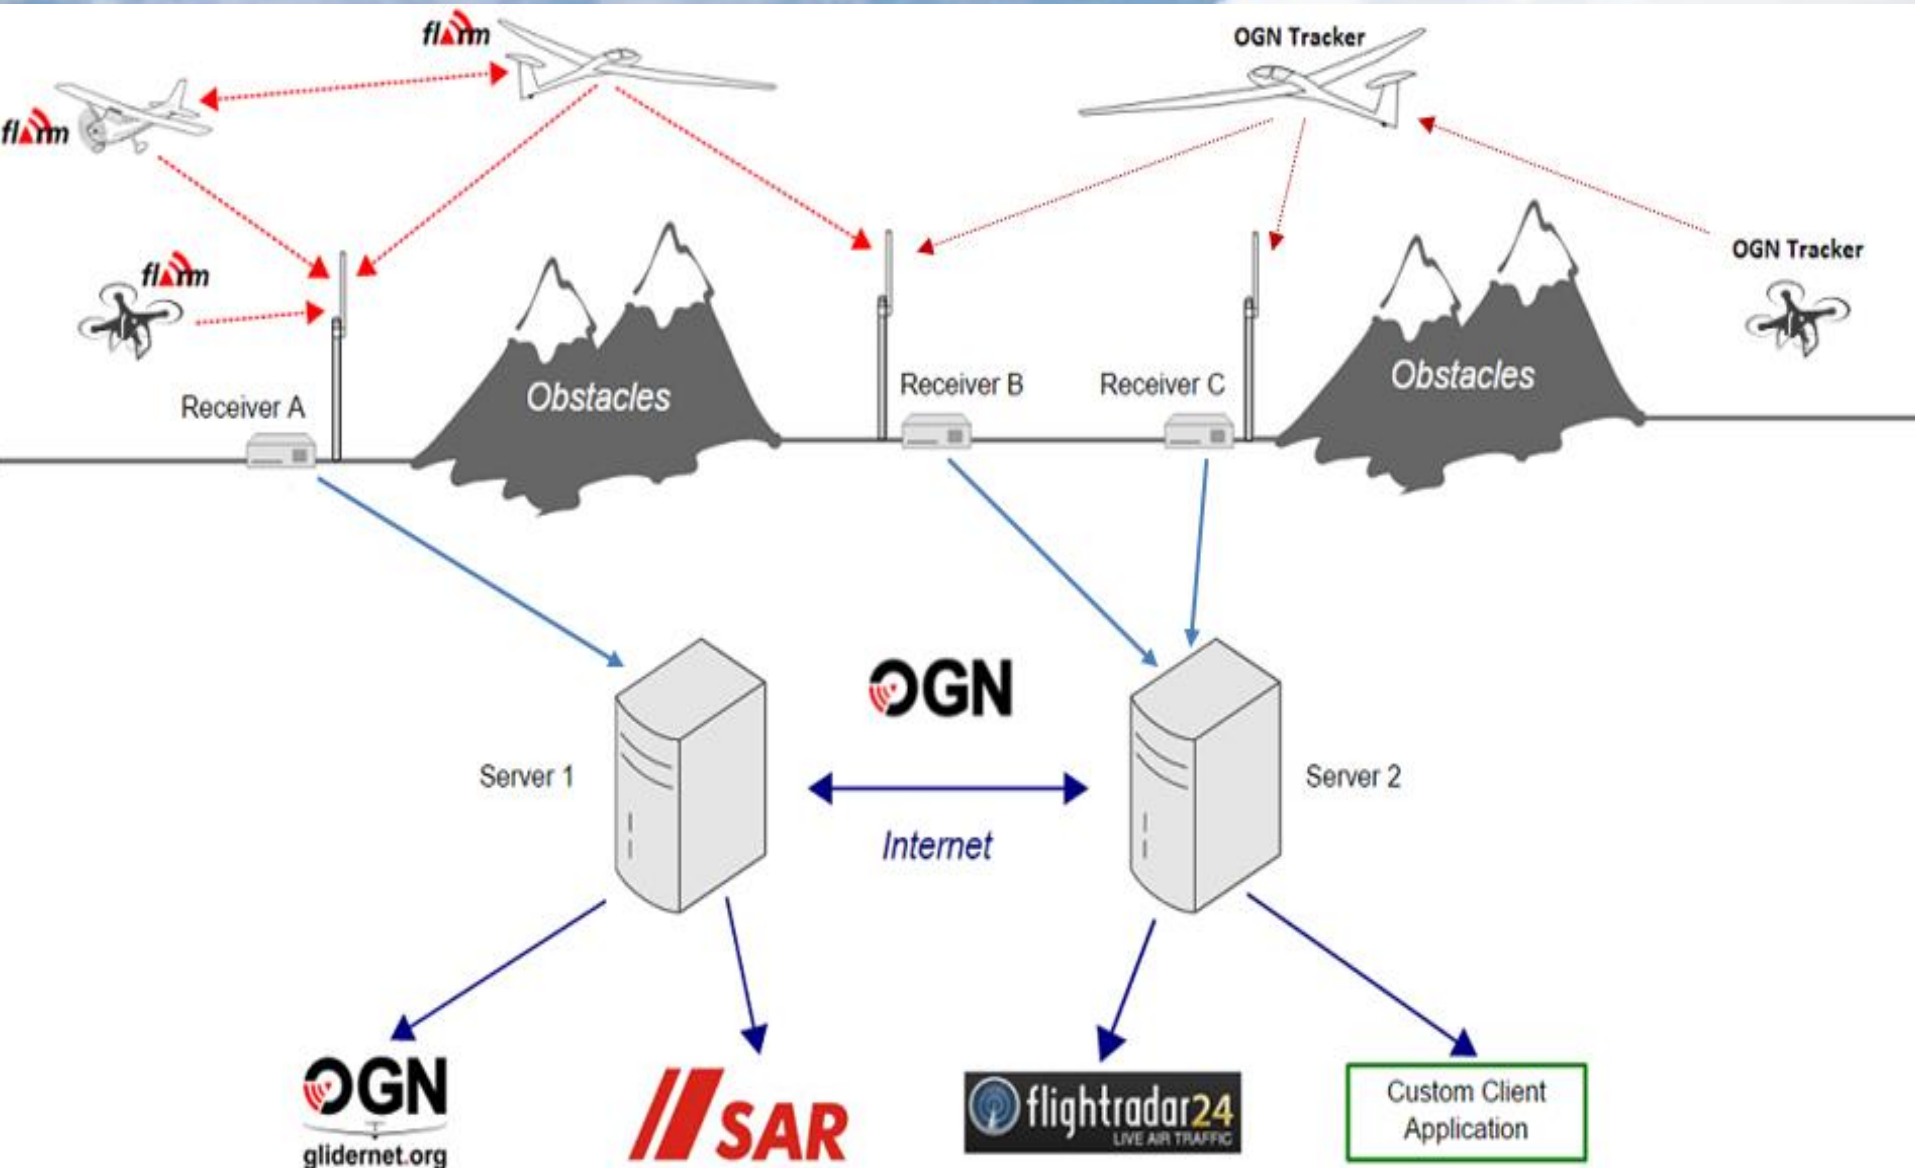

From <http://glidernet.org>

The objective of the Open Glider Network is to create and maintain a unified tracking platform for gliders, drones and other aircraft.

Focused on tracking aircraft equipped with FLARM and OGN trackers, OGN is also open for integration of other flying objects tracking data sources.

You can see beacons from FLARM PilotAware, SPOT, Garmin InReach, Skymaster, FANET (paragliders) and Spidertracks circulating through our network. The tracking data is freely available.

Open Glider Network

Why Have OGN?

(From Region 12 Report)

Creation of this OGN network will enhance the visibility and safety of soaring in Region 11. OGN receiver stations provide not only real time position reports and flight tracks of FLARM equipped gliders to computers and mobile devices with internet connections, but also provide real time data that could support search and retrieve/rescue operations.

If you are not familiar with the OGN network log into glidertracker.org and you will see all aircraft that have registered and transmitting FLARM devices. You will note heavy application of this technology in Europe and PASCO is actively supporting its introduction in our region.

Why Have OGN?

(From <http://glidernet.org>)

- Today FLARM is mainly utilized in gliders, however other small aircraft (planes, helicopters, deltas, para-gliders or even drones) are more and more often equipped with it, especially if operating in the areas intensively used by gliders, such as the Alps.
- Contrary to FLARM, OGN proposes an open transmission protocol and has an ambition to influence a standard for the tracking and surveillance.
- The OGN is a community project. It is based on software, hardware, receivers and other contributions from individuals and the open source community.

Why Have OGN?

(From <http://glidernet.org>)

- APRS linux based servers that receive and forward data. Data includes device location information, status of receivers, status of tracking devices (OGN trackers) and the status of the OGN APRS network itself.
- A device database (aircraft). Register your aircraft/drone with tracking device in the OGN device database here if you wish to influence the way how it's going to be visible in the system (anonymous vs recognized).
- OGN ground receivers, located at airfields, gliding clubs, summits of mountains or at private houses of our community members. They listen and decode radio beacons from aircraft in their vicinity and send position reports via network to the APRS servers.
- Software for Linux that can be installed on a PC or small mini-board computers (such as the Raspberry Pi, Cubieboard2, Odroid U3, etc.). It drives a USB DVB-T radio receiver and listens for, decodes, sends the position reports and participates in the OGN network.
- Websites and applications that can use and display the data. The most obvious use is to track aircraft on a moving map in real time, another use would be search and rescue (SAR), automatic flight logs, etc.

Open Glider Network

List of Countries Having OGN Receivers

Argentina	Italy
Australia	Lithuania
Austria	Namibia
Belgium	Netherlands
Canada	New Zealand
Chile	Norway
Czech Republic	Poland
Denmark	Romania
Estonia	Russia
Finland	Slovakia
France	Slovenia
Germany	South-Africa
Hungary	Spain
Iceland	Sweden
India	Switzerland
Indonesia	United States
Israel	United Kingdom

Open Glider Network

OGN Receiver Quantities in Selected Countries

Germany – 281

France – 196

United Kingdom - 166

France – 85

Switzerland – 91

Netherlands – 43

Australia – 39

Italy – 31

Chile – 23

South Africa – 15

Canada – 8

Namibia - 6

United States – 6

Online OGN Receiver Viewing

- Live Web Pages

- <http://live.glidernet.org>
- <http://glidertracker.org>
- <https://www.gliderradar.com/>
- <https://www.navplan.ch>

- For Android

- APRSDroid can be easily configured and used with OGN
- OGN viewer Live App for OGN
- Live viewer Live App by XCguide used by the paragliders folks

- PC software - XAstir program can be used to connect directly to one of the OGN servers and visualize APRS messages

OGN Receiving System

To set-up an OGN receiver you'll need

- 914MHz (US) Antenna and brackets \$50
- LNA Pre-amplifier \$50
- RG174 Coax \$30
- Type N to SMA Coax Adapter \$10
- DVB-T-Dongle (SMA to USB) \$40
- Computer / Raspberry \$50-\$200
- **Total Estimated Cost - \$200-\$300**
